

CMOS linear image sensor

S10077

Digital output, built-in 8/10-bit A/D converter, single power supply operation

The S10077 is a CMOS linear image sensor designed for image input applications. The signal processing circuit has a charge amplifier with excellent input/output characteristics. The circuit also includes a 8-bit/10-bit A/D converter.

Features

- Pixel pitch: 14 μm
Pixel height: 50 μm
- 1024 pixels
- Single power supply operation: 3.3 to 5 V
- On-chip charge amplifier with excellent input/output characteristics
- Built-in timing generator allows operation with only start and clock pulse inputs.
- Video data rate: 1 MHz max.
- Spectral response range: 400 to 1000 nm
- Digital output
- 8-bit/10-bit switchable ADC
- Simultaneous all-pixel integration and variable integration time function
- Low power consumption

Applications

- Analytical instruments
- Position detection
- Image reading

*9: Absolute value with respect to 0 digit

*10: Photoresponse nonuniformity (PRNU) is the output nonuniformity that occurs when the entire photosensitive area is uniformly illuminated by light which is 50% of the saturation exposure level. PRNU is measured using 1022 pixels excluding the pixels at both ends, and is defined as follows:

$$\text{PRNU} = \Delta X / X \times 100 (\%)$$

X: average output of all pixels, ΔX : difference between X and maximum or minimum output

Timing Chart

Parameter	Symbol	Min.	Typ.	Max.	Unit
Start pulse interval	$t_{pi}(\text{ST})$	$12339/f(\text{CLK})$	-	$120000/f(\text{CLK})$	s
Start pulse low period	$t_{lp}(\text{ST})$	$45/f(\text{CLK})$	-	-	s
Start pulse high period ^{*13}	$t_{hp}(\text{ST})$	$6000/f(\text{CLK})$	-	-	s
Start pulse rise and fall times	$t_r(\text{ST}), t_f(\text{ST})$	0	20	30	ns
Clock pulse duty	-	40	50	60	%
Clock pulse rise and fall times	$t_r(\text{CLK}), t_f(\text{CLK})$	0	20	30	ns

^{*13}: Signal charge integration time equals the high period of start pulse + 7 CLK cycles.

The shift register operation starts at the fall of CLK pulse immediately after ST pulse sets to low.

Integration time can be changed by changing the high-to-low ratio of ST pulses.

Precautions

(1) Electrostatic countermeasures

This device has a built-in protection circuit against static electrical charges. However, to prevent destroying the device with electrostatic charges, take countermeasures such as grounding yourself, the workbench and tools to prevent static discharges. Also protect this device from surge voltages which might be caused by peripheral equipment.

(2) Incident window

If dust or dirt gets on the light incident window, it will show up as black blemishes on the image. When cleaning, avoid rubbing the window surface with dry cloth or dry cotton swab, since doing so may generate static electricity. Use soft cloth, paper or a cotton swab moistened with alcohol to wipe dust and dirt off the window surface. Then blow compressed air onto the window surface so that no spot or stain remains.

(3) Soldering

To prevent damaging the device during soldering, take precautions to prevent excessive soldering temperatures and times. Soldering should be performed within 5 seconds at a soldering temperature below 260 °C.
