

S15597-01CT S15658-01CT

Compact APD suitable for various light level detection

The S15597-01CT and S15658-01CT are compact optical devices that integrate a Si APD and a preamp. They have a built-in DC feedback circuit for reducing the effects of background light. They also provide excellent noise and frequency characteristics. We provide an evaluation kit for these products. Contact us for detailed information.

Features

- High-speed response
- Two-level gain switch function
(low gain: single output, high gain: differential output)
- Reduced background light effects
- Small waveform distortion when excessive light is incident

Applications

- Distance measurement

Structure

Parameter	Symbol	S15597-01CT	S15658-01CT	Unit
Detector	-	Si APD		-
Photosensitive area size*1	A	$\phi 0.2$	$\phi 0.5$	mm
Package	-	Glass epoxy		-
Seal material	-	Silicone resin		-

*1: Photosensitive area in which a typical gain can be obtained

Absolute maximum ratings

Parameter	Symbol	Condition	Value	Unit
Supply voltage (for preamp)	Vcc max		4.5	V
Reverse voltage (for APD)	V _{APD}		0 to V _{BR}	V
Reverse current (DC)	I _R max		0.2	mA
Forward current	I _F max		10	mA
DCFB terminal voltage	-		Vcc + 0.7	V
Gain terminal voltage	-		Vcc + 0.7	V
Operating temperature	T _{opr}	No dew condensation*2	-40 to +105	°C
Storage temperature	T _{stg}	No dew condensation*2	-40 to +125	°C
Soldering temperature*3	T _{sol}		260 °C (twice)	°C

*2: When there is a temperature difference between a product and the surrounding area in high humidity environment, dew condensation may occur on the product surface. Dew condensation on the product may cause deterioration in characteristics and reliability.

*3: Reflow soldering, IPC/JEDEC J-STD-020 MSL 4, see P.8

Note: Exceeding the absolute maximum ratings even momentarily may cause a drop in product quality. Always be sure to use the product within the absolute maximum ratings.

Electrical and optical characteristics (Ta=25 °C)

Parameter	Symbol	Condition	S15597-01CT			S15658-01CT			Unit
			Min.	Typ.	Max.	Min.	Typ.	Max.	
Supply voltage	Vcc1, Vcc2		3.135	3.3	3.465	3.135	3.3	3.465	V
Spectral response range	λ		400 to 1100			400 to 1100			nm
Peak sensitivity wavelength	λ_p	M=100	-	840	-	-	840	-	nm
Photosensitivity	S	$\lambda=905$ nm, M=100 Low gain	100	150	240	100	150	240	kV/W
		$\lambda=905$ nm, M=100 High gain	1500	3200	5500	1500	3200	5500	
Breakdown voltage	VBR	ID=100 μ A	155	175	195	155	175	195	V
Temperature coefficient of breakdown voltage	Δ TVBR		0.8	1.0	1.2	0.8	1.0	1.2	V/°C
Current consumption	Ic	Low gain	15	25	34	15	25	34	mA
		High gain	17	26	37	17	26	37	
Low cutoff frequency	fcl	Low gain	-	0.01	-	-	0.01	-	MHz
		High gain	-	0.5	-	-	0.5	-	
High cutoff frequency	fch	Low gain	100	180	260	90	160	240	MHz
		High gain	90	160	230	80	150	220	
Output noise voltage	VON	f=20 MHz, M=100 High gain	-	2.0	-	-	2.0	-	mV rms
Output voltage level	-	Low gain	0.5	0.9	1.3	0.5	0.9	1.3	V
		High gain	0.5	1	1.5	0.5	1	1.5	
Output offset voltage	Voffset	High gain	-	-	\pm 100	-	-	\pm 100	mV
Maximum output voltage amplitude	Vp-p max	Low gain	-	-0.5	-	-	-0.5	-	V
		High gain	-	\pm 0.7	-	-	\pm 0.7	-	

Distance measuring method

Distance L is calculated from the time difference Td between the light source's light emission timing and sensor output and the speed of light c.

$$L = (1/2) \times c \times Td$$

Truth table

■ Gain

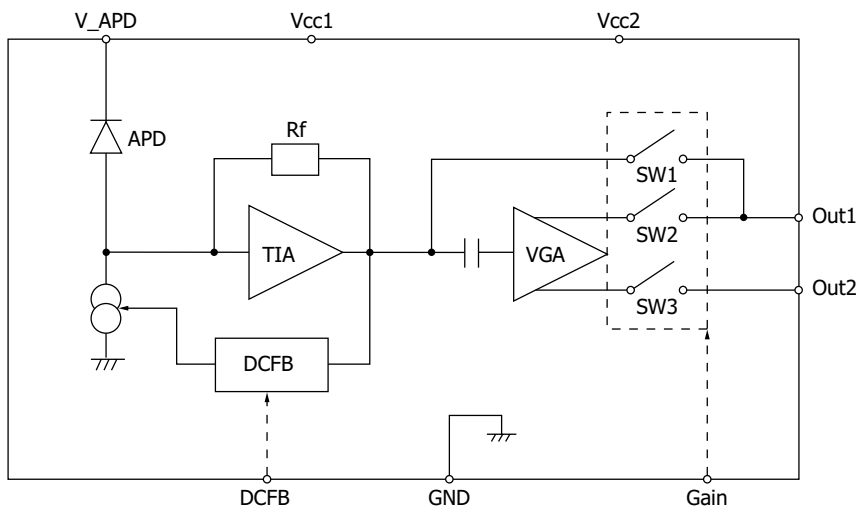

Setting	Gain
0	Low gain (× 1)
1	High gain (× 20)

■ DC feedback circuit

Setting	Background light elimination function
0	OFF
1	ON

Note: The pull-up resistor of the digital input terminal is 10 kΩ.

Block diagram

The DCFB (DC feedback) circuit detects the DC component of photocurrent, and reduces the effects of background light through the differential processor.

KPIC0364EA

Connection example (50 Ω system)

KPIC0365EA

When using the photosensor with front-end IC in a 50 Ω system, connect resistors with the same resistance (200 Ω in the above figure) to output loads Out1 and Out2. If resistors with the same resistance are not connected to the output loads, the waveform may be distorted or the output may oscillate.

❏ Handling of temperature characteristics of APD gain

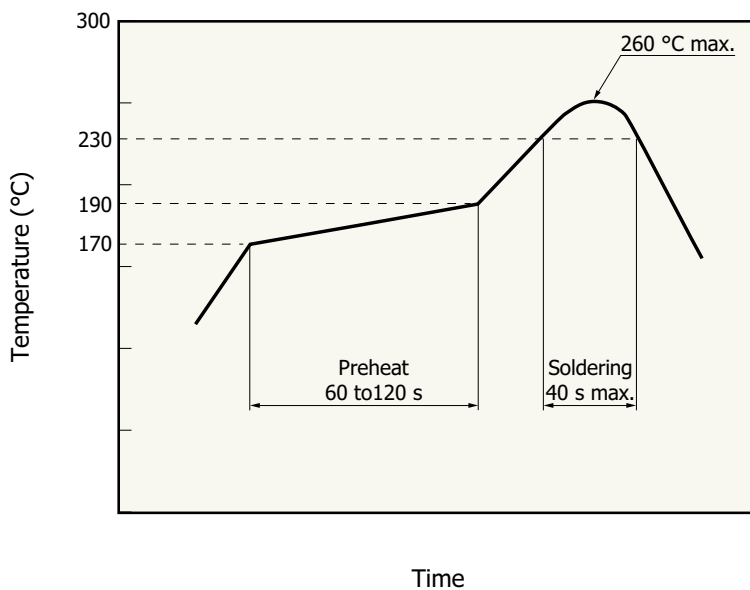

The gain of the APD built into the photosensor with front-end IC varies depending on the temperature. The following two methods are available for handling this issue in using the sensor over a wide temperature range.

- ① Temperature correction method, which controls the reverse voltage according to the temperature change
 A thermistor or other temperature sensor is installed near the APD to measure the APD’s temperature. The reverse voltage after APD temperature correction is expressed by the following equation using temperature T of the APD.

$$V_R \text{ (after temperature correction)} = V_R \text{ (at 25 } ^\circ\text{C)} + (T - 25) \times \Delta TV_{BR}$$

- ② Temperature control method, which keeps the APD temperature constant
 A TE-cooler or an equivalent device is used to maintain a constant APD temperature.

❏ Recommended soldering conditions

KPIC0346EA

- This product supports lead-free soldering. After unpacking, store it in an environment at a temperature of 30 °C or less and a humidity of 60% or less, and perform soldering within 72 hours.
- The effect that the product receives during reflow soldering varies depending on the circuit board and reflow oven that are used. Before actual reflow soldering, check for any problems by testing out the reflow soldering methods in advance.

Reel packing specifications

■ Reel (conforms to JEITA ET-7200)

Outer diameter	Hub diameter	Tape width	Material	Electrostatic characteristics
φ254 mm	φ100 mm	16 mm	PS	Conductive

■ Embossed tape (unit: mm, material: PS, conductive)

KPIC0366EA

■ Packing quantity

1000 pcs/reel

■ Packing state

Reel and desiccant in moisture-proof packing (vacuum-sealed)
