Driver circuit for CCD linear image sensor

C11165-02

For CCD image sensor (S11155/S11156-2048-02)

The C11165-02 is a driver circuit designed for Hamamatsu CCD image sensor S11155/S11156-2048-02. The C11165-02 can be used in spectrometers when combined with the S11155/S11156-2048-02.
The C11165-02 holds a CCD driver circuit, analog video signal processing circuit (16-bit A/D converter), timing generator, control circuit and power supply. The C11165-02 converts analog video signals from a CCD into digital signals and outputs them. The USB connector (USB 2.0) provided as a standard feature easily connects to a PC for the C11165-02 control and data acquisition. The C11165-02 also has a BNC connector for external trigger input and pulse output. The C11165-02 is compact, lightweight and very easy to handle.
Application software (DCam-USB) that comes with the C11165-02 allows easy operation from a PC running on Microsoft® Windows® 7 (32-bit, 64-bit)/10 (32-bit, 64-bit). A function library (DCamUSB.DLL) included with the application software helps you to develop your own software. This software is available with DLL to help you develop your own software programs under various developmental environments.

*1: Trigger input
*2: No condensation
When there is a temperature difference between a product and the surrounding area in high humidity environment, dew condensation may occur on the product surface. Dew condensation on the product may cause deterioration in characteristics and reliability.
Note: Exceeding the absolute maximum ratings even momentarily may cause a drop in product quality. Always be sure to use the product within the absolute maximum ratings.

Functions

Parameter		Specification
Operation mode display	Suspend mode (LED-off)	The power supply is turned off.
	Standby mode (LED-white)	It is a standby state, in which the data acquisition is possible.
	Data transfer mode (LED-green, aqua, blue)	In this mode, the driver circuit sends the data to PC.
Synchronous*7 mode	Internal synchronous mode ("INT" mode)	Data is acquired on the basis of the trigger timing generated by application software.
	External synchronous mode 1 ("EXT.EDGE" mode)	Data is acquired in synchronization with the external trigger signal input from the BNC connector. In synchronization with an edge of the external trigger signal, data is accumulated for the set integration time and is then output.
	External synchronous mode 2 ("EXT.LEVEL" mode)	Data is acquired in synchronization with the external trigger signal input from the BNC connector. Data is accumulated for a period equal to the pulse width of the external trigger signal and is then output.
Gain adjustment		The gain value can be varied in the range of "1 to 3" with the step of 1. Default value is "1".
Offset adjustment		The offset value can be varied in the range of "-255 to 255" with the step of 1. Default value is "10".
External signal	Input	Acquires data in synchronization with trigger pulse input to the BNC connector
	Output	Sets the timing for the pulse signal output from the pulse output BNC connector of the driver circuit
MPP operation	MPP mode	The REGH/REGL signal goes Low during integration.
	Non-MPP mode	The REGH/REGL signal is constantly fixed to High.
Electronic shutter ON/ OFF function	ON mode	Performs integration only during the set period in one line period
	OFF mode	Constantly performs integration in one line period

*7: External synchronous mode 2 ("EXT. LEVEL" mode) cannot be used when the electronic shutter is OFF.
