

CCD area image sensor

S10747-0909

Enhanced near-infrared sensitivity by using fully-depleted CCD technology

The S10747-0909 is a back-illuminated CCD area image sensor that has significantly improved near-infrared sensitivity and soft X-ray detection efficiency. This has been achieved by using a thick silicon substrate that allows the depletion layer to be thickened by applying a bias voltage.

Features

- Quantum efficiency: 70% ($\lambda=1000$ nm, $T_a=25$ °C)
- Pixel size: 24 × 24 μm
- 512 × 512 pixels
- Low readout noise

Applications

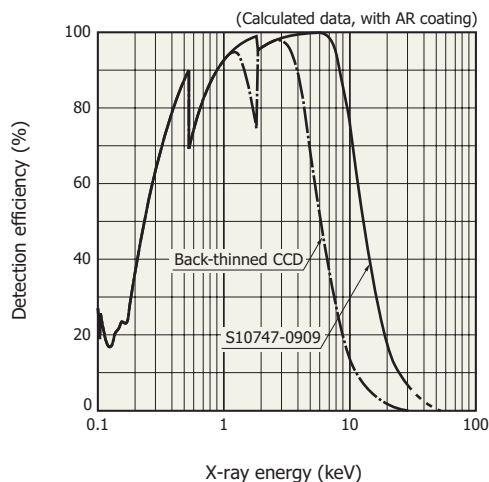

- Space telescope

General ratings

Parameter	Specification
Pixel size	24 (H) × 24 (V) μm
Number of pixels	532 (H) × 520 (V)
Number of active pixels	512 (H) × 512 (V)
Active area	12.288 (H) × 12.288 (V) mm
Vertical clock phase	2 phases
Horizontal clock phase	2 phases
Output circuit	One-stage MOSFET source follower
Package	24-pin ceramic DIP (refer to dimensional outline)
Window	None (temporary glass window)

Structure of fully-depleted back-illuminated CCD

Back-thinned CCDs the silicon substrate is only a few dozen microns thick. This means that near-infrared light is more likely to pass through the substrate (see Figure 1), thus resulting in a loss of quantum efficiency in infrared region. Thickening the silicon substrate increases the quantum efficiency in the near-infrared region but also makes the resolution worse since the generated charges diffuse into the neutral region unless a bias voltage is applied (see Figure 2). Fully-depleted back-illuminated CCDs use a thick silicon substrate that has no neutral region when a bias voltage is applied and therefore deliver high quantum efficiency in the near-infrared region while maintaining a good resolution (see Figure 3). One drawback, however, is that the dark current becomes large so that these devices must usually be cooled to about -70 °C during use.

Device structure (conceptual drawing of top view)

Note: When viewed from the direction of the incident light, the horizontal shift register is covered with a thick silicon layer (dead layer). However, long-wavelength light passes through the silicon dead layer and may possibly be detected by the horizontal shift register. To prevent this, provide light shield on that area as needed.

⚠ Precaution for use (Electrostatic countermeasures)

- Handle these sensors with bare hands or wearing cotton gloves. In addition, wear anti-static clothing or use a wrist band with an earth ring, in order to prevent electrostatic damage due to electrical charges from friction.
- Avoid directly placing these sensors on a work-desk or work-bench that may carry an electrostatic charge.
- Provide ground lines or ground connection with the work-floor, work-desk and work-bench to allow static electricity to discharge.
- Ground the tools used to handle these sensors, such as tweezers and soldering irons.

It is not always necessary to provide all the electrostatic measures stated above. Implement these measures according to the amount of damage that occurs.

⚠ Element cooling/heating temperature incline rate

Element cooling/heating temperature incline rate should be set at less than 5 K/min.
